## Random vs targeted transgene insertion: homologous recombination

### Strategy:

Support the transgene in 3' and 5' with sequences  
Complementary to the genomic region of interest

# Scheme

# Homologous recombination in stem cells

1 DNA is introduced into embryonic stem (ES) cells. The DNA contains a non-functional copy of the gene of interest, an antibiotic resistance gene (Neo) and a gene encoding a viral enzyme (TK) thymidin kinase

2 ES cells are grown in culture.

3 Cells containing DNA are selected using an antibiotic (neomycin).

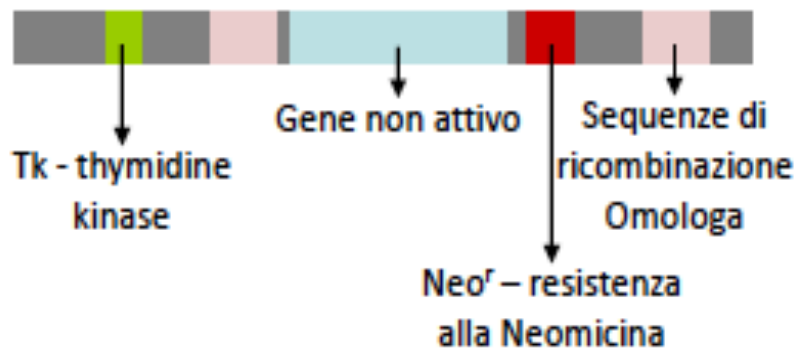

4 Cells in which the DNA has inserted by recombination are selected using an antiviral drug (ganciclovir).

5 "Knockout" cells are inserted into a host embryo.

6 Resulting mice are bred to produce "knockout" mice.

# Selection of cells with transgene in the correct position

# Transgenic mouse : Workflow

# Targeted insertion of a transgene serves to:

- **KNOCK-OUT: INATTIVAZIONE** dell'espressione di un gene
- **KNOCK-IN: INSERZIONE** di un gene difettivo/selvatico (modelli di patologie con mutazioni puntiformi; geni reporter)

## Limite KO costitutivi:

possibile mortalità degli omozigoti durante lo sviluppo.

## KO condizionali:

l'induzione della mutazione  
**tempo** e **tessuto** specifica

# Conditional transgenesis: The Cre-LoxP system

Eliminate / activate a given gene in a given tissue, organ, or  
In a particular phase of development

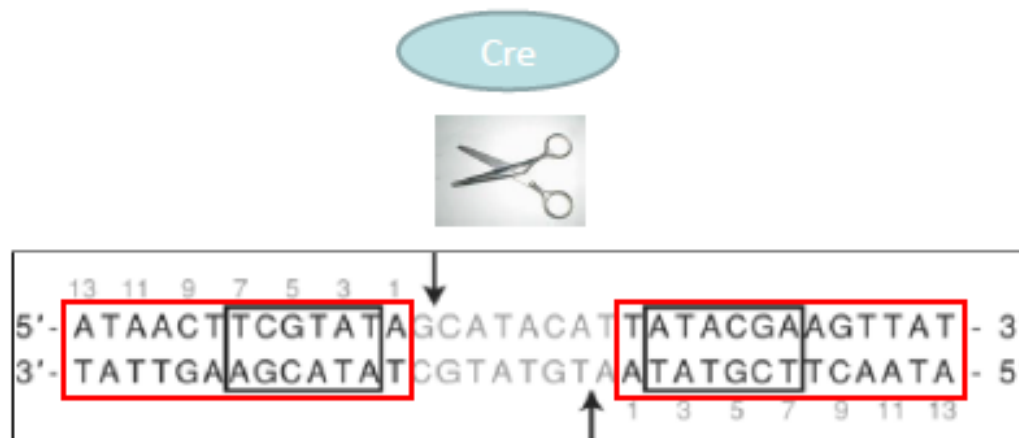

**Sistema di RICOMBINAZIONE del fago P1**

“Causes recombination”

**CRE (cyclization recombination), ricombinasi specifica**

**LoxP (locus of X-over P1), locus di crossover**

(2 seq palindrome di 13bp + regione centrale di 8nt)

F<sub>0</sub> Generation

Cre Mouse

LoxP (Floxed) Mouse

# Conditional transgenesis, the TET OFF / TET ON system

*Sistema a 3 elementi:*

- **TeT-Repressor:** repressore della trascrizione
- **Tc/Dox:** tetraciclina/doxyciclina
- **TRE:** tetracycline response element

## a TET-OFF

Tet-off system

**TetR: tet repressor**

**VP16: transactivation domain  
of herpes simplex virus**

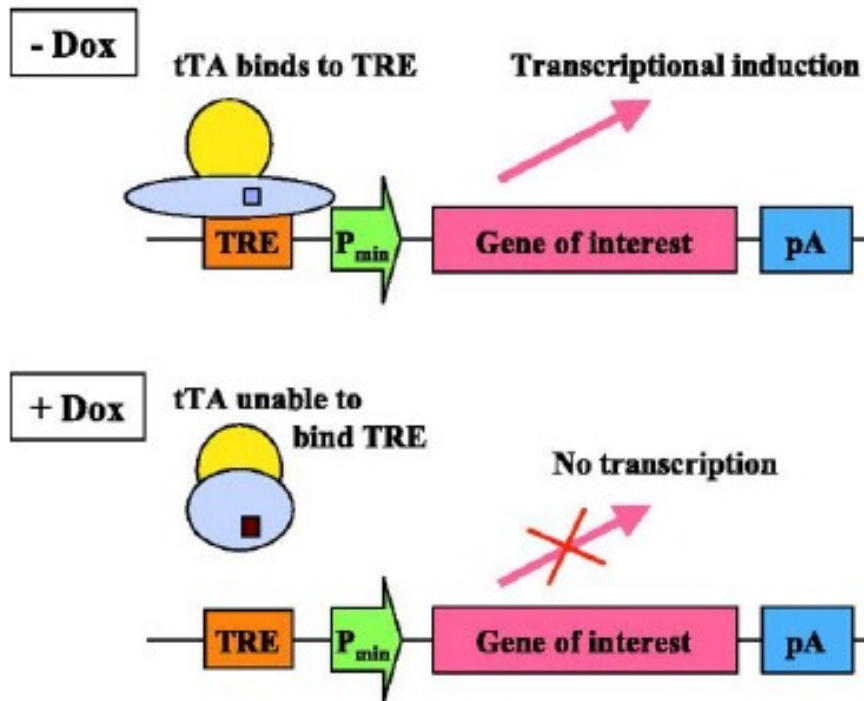

**tTA**

**tTA**

**Tetraycline controlled  
transactivator**

# Sistema TET-OFF

tTA: tetracycline controlled transactivator

Tet-off system (tTA) will activate expression in the absence of its ligand doxycycline.

Upon addition of DOX, transcription of the gene of interest is extinguished.

# Sistema TET-ON

Tet-on system

**rTetR: reverse tet repressor**  
**VP16: transactivation domain**  
**of herpes simplex virus**

**rtTA**

**rtTA**

**Reverse tet-on**  
**Tetraycline controlled**  
**transactivator**

# Systema TET-ON

rtTA: reverse tet-on  
tetracycline  
controlled  
transactivator

Tet-on

■ + DOX

- Dox

No transcription

+ Dox

rtTA binds to TRE

Transcriptional induction

Addition of DOX to the Tet-on system (rtTA) results in transcriptional induction of the gene of interest.

# Principali tipi di vettore virale: caratteristiche

Vettore virale	Vantaggi	Svantaggi
<b>Retrovirus</b>	Capacità d'inserimento del gene, integrazione stabile nel DNA dell'ospite, elevati titoli di virus ricombinante, ampio tropismo d'infettività, relativa facilità di manipolazione del genoma virale	Difficoltà nel controllare l'infezione virale, mancata infezione delle cellule non in divisione, integrazione a caso nel genoma dell'ospite
<b>Lentivirus</b>	Infezione delle cellule in divisione o meno, espressione stabile del gene, elevata capacità d'inserimento	Mutagenesi potenziale presenza di sequenze proteiche regolatrici e accessorie
<b>Adenovirus</b>	Elevati titoli di virus, alta espressione genica, grande capacità d'inserimento, infezione di cellule in divisione e non in divisione	Risposte immuni alle proteine virali, nessuna integrazione nel genoma dell'ospite, espressione genica transitoria
<b>Virus adeno-associati</b>	Infettano le cellule in divisione o meno, ampio tropismo cellulare, potenziale d'integrazione, bassa immunogenicità e non patogenicità	Limitate capacità per i transgeni, difficile generazione di alti titoli virali, presenza di adenovirus o herpesvirus per la moltiplicazione dei virus adeno-associati
<b>Herpesvirus</b>	Infettano un'ampia varietà di tipi cellulari, alta capacità d'inserzione, tropismo naturale per le cellule neuronali, seguita dalla produzione di alti titoli virali	Possibile tossicità, rischio di ricombinazione, nessuna integrazione virale nel DNA dell'ospite
<b>Poxvirus</b>	Alta capacità d'inserzione, possibile inserzione di grandi frammenti di DNA, alti livelli di espressione transgenica, seguita da virus vivo ricombinante	Possibile effetto citopatico
<b>Virus di Epstein-Barr</b>	Infetta cellule in divisione o meno con prevalenza per i linfociti B, alta capacità d'inserimento	Difficoltà di controllare le linee cellulari

# Transgenesis induced with retroviral vectors. workflow

# Advantages and disadvantages of transgenesis with viral vectors

**Advantages:**  
**high transfection efficiency**

**Problems:**

**Possibility to generate new viruses**

**May induce mutations**

**Small DNA can be inserted**

**Immunological complications**

**High costs**

## **Yeast Artificial Chromosome – YAC**

**Possibility to insert large DNA sequences**

**Full artificial chromosomes,  
origin or duplication, telomeres, etc**

# Yeast Artificial Chromosome - YAC

Figure: Construction of a yeast artificial chromosome (YAC)

# Yeast Artificial Chromosome – YAC SCHEME -

Generation of YAC-transgenic mice

# EDITING A GENE USING THE CRISPR/CAS9 TECHNIQUE

- 1** Scientists create a genetic sequence, called a "guide RNA," that matches the piece of DNA they want to modify.

- 2** This sequence is added to a cell along with a protein called Cas9, which **acts like a pair of scissors** that cut DNA.

- 3** The guide RNA homes in on the target DNA sequence, and Cas9 **cuts it out**. Once their job is complete, the guide RNA and Cas9 leave the scene.

- 4** Now, another piece of DNA is swapped into the place of the old DNA, and **enzymes repair the cuts**. Voilà, you've edited the DNA!

# Transgenesis in large animals - livestock

## Advantages

TABLE 1: Comparison of the different systems used to produce recombinant pharmaceutical proteins.

Production level	
Investment cost	
Production cost	
Scaling-up ability	
Collection

# The three approaches to the production of transgenic animals modifying the male gametes

Celebi C et al. Biol Reprod 2003;68:1477-1483

## **The three approaches to the production of transgenic animals modifying the male gametes**

**Exposure of spermatozoa ejaculated with the DNA construct  
(sometimes with pre-treatment - thermal shock - permeabilization -  
Electroporation - to facilitate DNA uptake)**

**Injection of the DNA construct by the endotesticular way (deferent-secret testis)**

**Intra-testicular injection of genetically modified germ cells  
(it is necessary to eliminate the germ cells "resident" before)**

**Application in the mouse; method still in experimental phase  
So far low efficiency**

# Sperm – mediated transgenesis controversial .....

## Exposure to DNA is insufficient for *in vitro* transgenesis of live bovine sperm and embryos

Mohsen Forouzanfar<sup>5</sup>, Mehdi Hajian<sup>4</sup>, Fleur Oback<sup>3</sup>, Mohammad H Nasr-Esfahani<sup>4</sup> and  
Björn Oback<sup>3</sup>

Gene Transferred	Objective	Achievements	Remarks
<b>Mice and Swine</b> Human hemoglobin and specific circulating immunoglobulins (antibodies)	Proteins from blood serum for blood transfusion and disease diagnosis	Genes expressed; proteins released in blood serum	Experimental stages
<b>Rabbits</b> Human genes: Interleukin 2, growth hormone, tissue plasminogen activator, $\alpha_1$ -antitrypsin, etc. Bovine gene: $\alpha$ -lactoglobulin	Molecular farming or gene farming	Genes expressed in mammary tissue; proteins harvested from milk	Experimental stage
<b>Sheep</b> Bacterial genes cys E and cys M (genes concerned with cysteine biosynthesis) Human growth hormone	Improved wool production/quality  Increased and desirable body growth	Genes achievement in transgenic animals  Improvements in body weight gain, feed efficiency. Fat composition, etc.	  Produces joint pathology, skeletal defects, ulcers infertility, etc.
<b>Cattle, Goat, Sheep and Swine</b> Human genes $\alpha_1$ antitrypsin, tissue plasminogen activator, blood clotting factor IX, and protein C.	Gene farming	Genes expressed in mammary tissue; protein secreted in milk in functional form	Experimental stages
<b>Fish</b> Salmon or rainbow trout growth hormone	Increased body growth	Upto 60% increase in size	Transgenes stably inherited; growth improve by selection.
Anti-freeze protein, $\alpha$ -globin gene, chicken $\delta$ -crystalline protein gene, etc.	Variable	Genes expressed in transgenic individuals	Transgenes are stably inherited.

## Increase the amount of milk with transgenesis (pronuclear injection)

**Figure 1: A litter of  $\alpha$ -LA transgenic piglets.**

Transgenic sows produce up to 70% more milk than control non-transgenic litter mates. Piglets grow up to 500 gm more during a 21d lactation (Noble *et al.* 2002). © 2013 [Nature Education All rights reserved.](#)

## Increase the amount of milk with transgenesis (pronuclear injection)

**Figure 2: Can transgenic technology produce comparable milk volume?** Small improvements in milk volume in Guzerat cows (left) using genetic material from high-producing Holsteins (right) could have a significant impact on Brazilian beef production (Wheeler **et al.** 2010).

**By simplifying transgenesis in farm animals:  
Direct injection of lentiviral vectors into oocytes or embryos**

# Generation of transgenic cattle (only GFP reporter gene)

Hofmann A et al. Biol Reprod 2004;71:405-409

# Generation of transgenic swine (only GFP reporter gene)

# Generation of transgenic sheep (only GFP reporter gene)

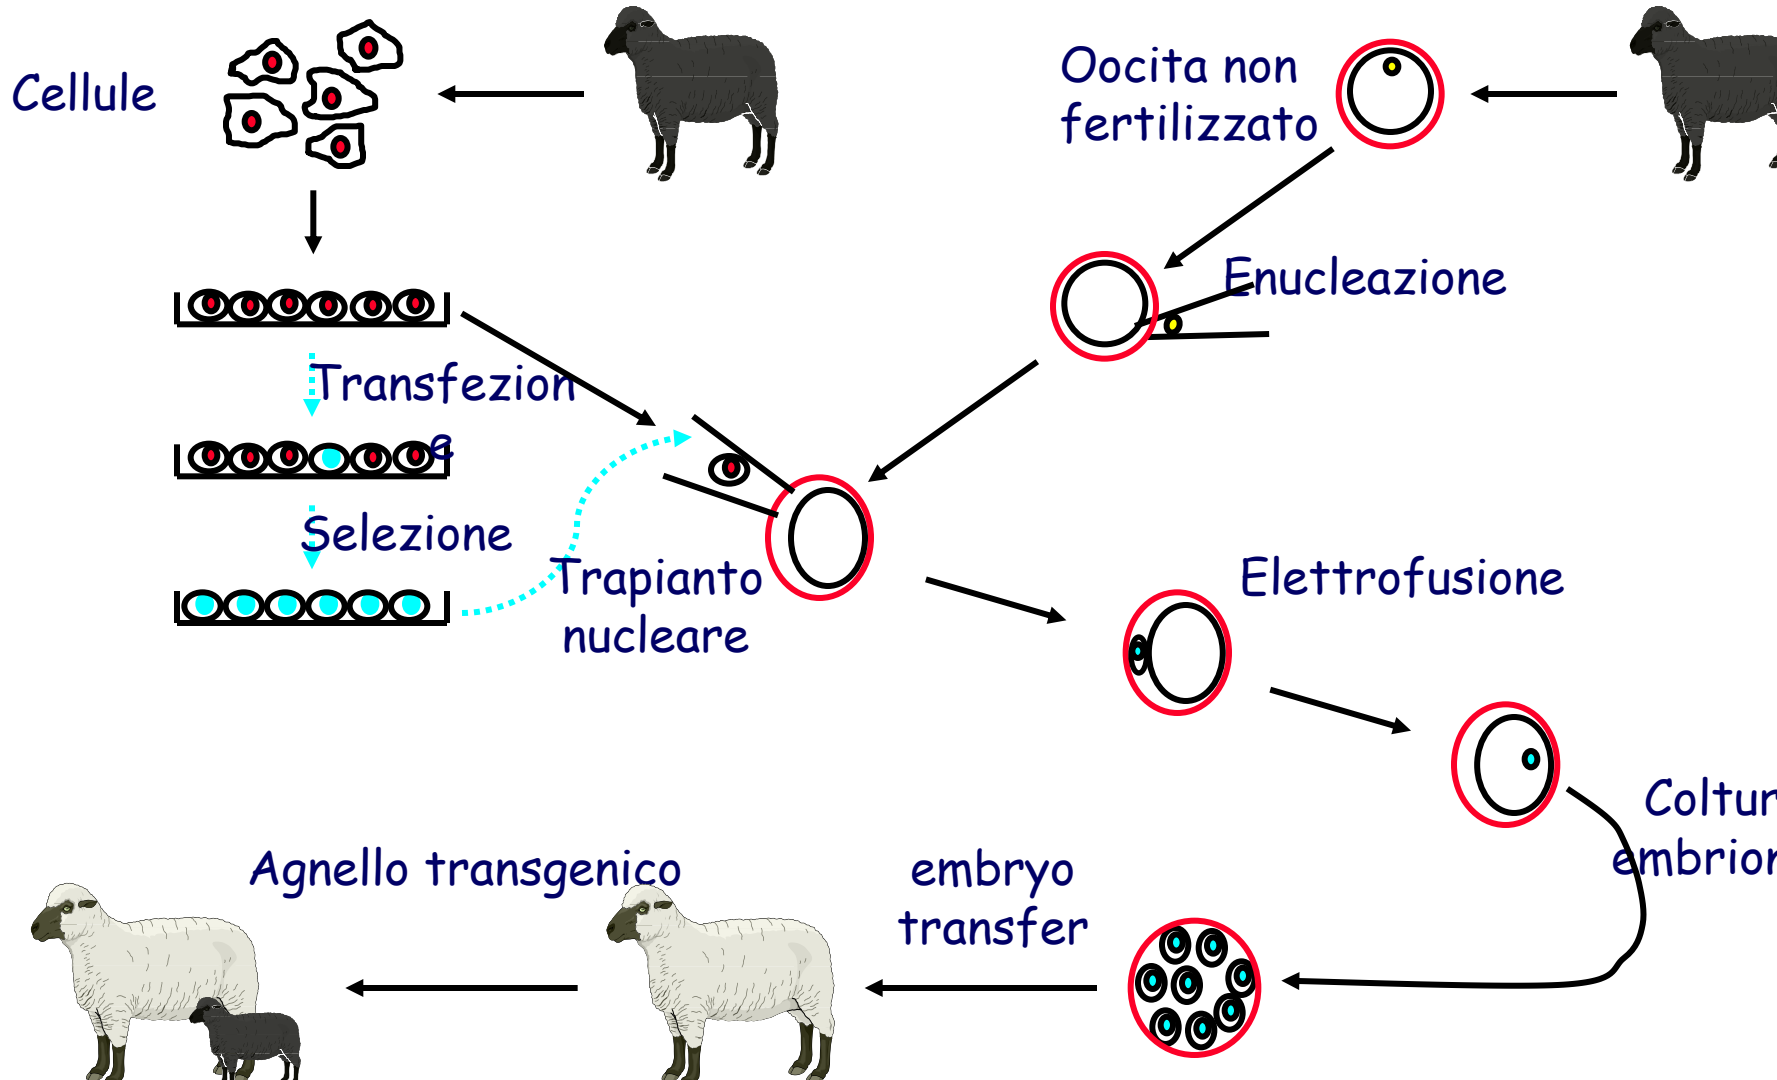

Liu C, Wang L, Li W, Zhang X, et al. (2013) Highly Efficient Generation of Transgenic Sheep by Lentivirus Accompanying the Alteration of Methylation Status. *PLoS ONE* 8(1): e54614. doi:10.1371/journal.pone.0054614

<http://www.plosone.org/article/info:doi/10.1371/journal.pone.0054614>

# Human proteins produced by transgenic animals obtained with pronuclear injection:

- Pigs: Factor VIII
- Sheep: Factor IX; human AAT (clinical trial phase III)
- cattle: Lactoferrin (anti-inflammatory / Immunomodulatory)
- goats: Anti-thrombin IIIa (clinical trial phase III)
  
- Most reliable transgenic production technique at the moment
- Advantages:
- Large quantities (of the order g / L; ex. Factor Requirement IX = 2Kg / year)
- Production of any type of protein

# Transgenesis with nuclear transplantation (cloning) with somatic cells

# Nuclear Transfer Vs Microinjection

## Microinjection

## Nuclear transfer

**Cupid and Diana - transgenic products (nuclear transplant)  
with homologous recombination  
They express the Alpha Anti-trypsin 1 (cystic fibrosis therapy).  
Campbell, Nature 2003**

# Elimination of endogenous genes (Prion)

**FIGURE 27.1** *PNRP* homozygous knockout cattle produced by BioDak, LLC. This cohort of genetically engineered, cloned Holstein bull calves come from a single genetically modified cell line containing a functional knockout of both alleles of the *prion protein* gene locus.

**FIGURE 27.2** Genetically engineered, cloned, crossbred dairy heifers produced from a single genetically modified cell line containing a human artificial chromosome (HAC) and functional knockouts of the four alleles of the bovine immunoglobulin- $\mu$  heavy chain loci. These cattle are known as transchromosomic (Tc) bovine and the HAC they possess contains the entire repertoire of the human antibody genes. After hyperimmunization with a target antigen, these animals undergo plasmapheresis to collect large volumes of plasma containing targeted polyclonal human antibodies. The antibodies are purified from the plasma to produce human antibody therapeutics.

# Transgenic pig for "humanization" of organs pigs for xenotransplantation

- Lai et al & Dai et al., 2002 reported disruption of one allele of GGTA1

## MEDICAL REVOLUTION THE ORGANS THAT COULD HELP

Trials of pig tissue transplanted into humans to treat diabetes, Parkinson's disease and blindness are "imminent" but solid organ transplants - hearts, kidneys, livers - are still "several years away".

**KEY** ● Imminent ● Years away

**Pancreatic islets**  
to treat diabetes

**Brain cells** to  
treat Parkinson's  
and Huntington's  
disease

**Red blood cells**  
for transfusion

**Eye tissues**  
corneas etc.

**Heart**

**Kidney**

**Liver**

**Small bowel**

**Lungs**
