prodotto da un apparecchio

Radiologia tradizionale

TAC

Applicazioni
angiografiche, vascolari

Radiazioni ionizzanti nella diagnosi:

Medicina nucleare

Immagini della distribuzione nel corpo di un farmaco marcato con un radionuclide emettitore di radiazioni γ o di positroni

Outline

- Standard MRI techniques (T1, T2, FLAIR ...) and clinical applications;
- Perfusion MRI
- Angio MRI
- fMRI;
- DTI;
- MRI and multimodal imaging;
- Very high and ultra-low field MRI

Introduction

MRI applications can be grouped into:

- Clinical Neurology
 - Neuroimaging, e.g. demyelinating diseases, dementia, cerebrovascular disease, neurodegenerative diseases (Epilepsy, Parkinson, Alzheimer, Huntington ...), in general functional and structural brain abnormalities, development and aging
- Cancer
 - Breast, colorectal, Brain
 - MRI guided stereotactic surgery and radiosurgery

Introduction

- Cardiovascular
 - Myocardial ischemia and viability, cardiomyopathies, myocarditis, iron overload, vascular diseases and congenital heart disease
- Musculoskeletal
 - Spinal imaging, assessment of joint disease and soft tissue tumors
- Liver and gastrointestinal
- Food quality control

Comparison MRI vs other imaging techniques in terms of invasiveness

MRI advantages

- Excellent soft tissue contrast resolution
- Ability to obtain direct transverse, sagittal, coronal and oblique images
- No ionizing radiation
- No bone-air artifacts
- A very rich information coming from a large set of parameters determining the MRI contrast

“OK, Mrs. Dunn. We’ll slide you in there, scan your brain, and see if we can find out why you’ve been having these spells of claustrophobia.”

MRI disadvantages

- Long imaging time
- Complexity of equipment and scan acquisition
- High cost
- Low resolution for calcification or bone details
- Not all subjects can undergo MRI (any metallic fragment may become projectile, no pace maker, dental implants, heart valves, aneurism clips, claustrophobia?)

MRI compared to CT

COMPARISON	MRI	CT SCAN
Soft Tissue	Much higher detail in soft tissues	Less detailed in soft tissue
Bony Structures	Less detailed when compared with CT Scan	More detail about bony structures
Effects on the body	No hazards reported	Small risk of irradiation
Cost	Cost can vary from \$1400 to \$4000 (when used with contrast). Generally more expensive than CT Scans and x-rays	Cost ranges from \$1200 to \$3200. Generally less than MRIs
Also known as:	Magnetic Resonance Imaging	Computed Tomography
Exposure to Radiation	None	Moderate
Time Taken to scan	Typically 30 to 45 minutes	Generally within 5 minutes

MR exam clinical setting

- Equipe and responsibilities:
 - Patient
 - Technician
 - Patient registration (from informed consent)
 - Check patient compliance with MRI exam (clips etc...) sometimes a metal detector is used
 - Let the patient in the scanner
 - Patient positioning
 - Perform exam
 - Let the patient out the MRI room

MR exam clinical setting

- Physicist
 - Setup the imaging protocol
 - Quality control (B0 homogeneity, coils)
 - Develop new sequences or optimize existing ones
 - Data analysis
- Anesthetist (when contrast agent is administered)
- Nurse (difficult patients and help with the contrast agent administration)
- Physician (Radiologist / Neuro-radiologist)
 - Verify and sign the informed consent to allow patient in the MR room
 - Report on the MRI findings

MR clinical setting

FONDAZIONE SANTA LUCIA

ISTITUTO DI RICOVERO E CURA A CARATTERE SCIENTIFICO

Ospedale di rilievo nazionale e di alta specializzazione per la riabilitazione neuromotoria

QUESTIONARIO PER L'ACCESSO ALLA SALA DI RISONANZA MAGNETICA CON APPARECCHIATURA A 3 TESLA

Cognome _____ Nome _____

Luogo di nascita _____ Data di nascita _____

Luogo di residenza/domicilio _____ indirizzo _____ Telefono/cellulare _____

Protocollo di studio: _____

Ricercatore con recapito telefonico: _____

ATTENZIONE: I PORTATORI DI PACE MAKER CARDIACO, DI APPARECCHIATURE ELETTRONICHE IMPIANTATE O DI ELEMENTI METALLICI FERROMAGNETICI MOBILI NON POSSONO SEGUIRE L'ESAME RM.

Per i portatori di impianto protesico occorre produrre al momento dell'esame RM la certificazione di compatibilità elettromagnetica del materiale utilizzato per la protesi rilasciata dal servizio che ha effettuato l'intervento.

	Si	No		Si	No
Ha già eseguito un esame di RM ?	<input type="checkbox"/>	<input type="checkbox"/>	se sì, quando? _____		
E' portatore di PACE MAKER cardiaco?	<input type="checkbox"/>	<input type="checkbox"/>	Soffre di claustrofobia?	<input type="checkbox"/>	<input type="checkbox"/>
E' portatore di defibrillatore cardiaco?	<input type="checkbox"/>	<input type="checkbox"/>	Per Pazienti di sesso femminile:		
E' portatore di valvole o cateteri cardiaci?	<input type="checkbox"/>	<input type="checkbox"/>	E' in stato di gravidanza?	<input type="checkbox"/>	<input type="checkbox"/>
E' portatore di protesi al cristallino?	<input type="checkbox"/>	<input type="checkbox"/>	Data ultime mestruazioni: _____		
Ha <u>neurostimolatori</u> o elettrodi nel cervello?	<input type="checkbox"/>	<input type="checkbox"/>	E' portatrice di corpi intra-uterini?	<input type="checkbox"/>	<input type="checkbox"/>
Ha cateteri e valvole di derivazione ventricolo-peritoneale?	<input type="checkbox"/>	<input type="checkbox"/>	Ha mai subito interventi chirurgici?	<input type="checkbox"/>	<input type="checkbox"/>
Ha corpi metallici o impianti per udito?	<input type="checkbox"/>	<input type="checkbox"/>	Se sì, indicare quali e in che data:		
Ha pompe per infusione di farmaci?	<input type="checkbox"/>	<input type="checkbox"/>	_____		
Ha clips per aneurismi, clips chirurgiche, viti, chiodi, fili o schegge metalliche?	<input type="checkbox"/>	<input type="checkbox"/>	_____		
Ha subito incidenti stradali o di caccia?	<input type="checkbox"/>	<input type="checkbox"/>	_____		
Ha mai lavorato come saldatore, tomitore, fabbro, carrozziere?	<input type="checkbox"/>	<input type="checkbox"/>	_____		
E' affetto da anemia falciforme?	<input type="checkbox"/>	<input type="checkbox"/>	_____		
E' portatore di piercing e/o tatuaggi?	<input type="checkbox"/>	<input type="checkbox"/>	_____		

ACCESSO ALLA ZONA CONTROLLATA DI RM 3 TESLA

PRIMA DI ENTRARE NELLA ZONA AD ACCESSO CONTROLLATO OCCORRE TOGLIERE QUALSIASI OGGETTO METALLICO, MECCANICO O ELETTRONICO O MAGNETICO E ALTRI OGGETTI CHE POSSANO DANNEGGIARE IL PAZIENTE/VOLONTARIO O DANNEGGIARSI A SEGUITO DELL'ESPOSIZIONE AL CAMPO MAGNETICO E A ONDE DI RADIOFREQUENZA.

IN PARTICOLARE: lenti a contatto rigide, apparecchi per l'udito, protesi dentarie mobili, reggiseno con ferretto o parti metalliche, fermagli, mollette, occhiali, gioielli, orologi, carte di credito o schede magnetiche, ferma-soldi, monete, chiavi, ganci, bottoni metallici, spille, indumenti con lampo, punti metallici (quelli applicati in tintoria). E' necessario rimuovere prodotti cosmetici dal volto per la RM cerebrale.

Avete rimosso tutti gli oggetti metallici? SI NO

Il paziente/volontario, informato sulle modalità di svolgimento dell'esame RM, sulle complicanze e rischi eventuali ad esso connessi,

Acconsente al trattamento dei suoi dati personali e sensibili secondo il Testo Unico sulla privacy DL. n. 196/2003 per le finalità dell'esame RM: SI NO

Acconsente al trattamento in forma anonima dei suoi dati e dei dati derivanti dall'esame RM per finalità di ricerca scientifica da parte dei medici e ricercatori della IRCCS Fondazione Santa Lucia: SI NO

Letto e approvato, acconsente all'accesso alla sala RM SI NO

Data: _____ Firma del paziente/volontario _____

Data _____ Firma del Medico radiologo _____

CONSENSO ALLA SOMMINISTRAZIONE DI MEZZO DI CONTRASTO (COMPILARE SOLO SE LA SOMMINISTRAZIONE E' PREVISTA DAL PROTOCOLLO)

La somministrazione del mezzo di contrasto avviene per via parenterale e può, raramente, provocare disturbi di tipo allergico generalmente di scarsa entità, tipo orticaria a rapida risoluzione.

Ha mai avuto reazioni allergiche a sostanze o a mezzi di contrasto? SI NO

In relazione alla nota informativa dell'AIFA del 26-06-2007 si informa che è stata osservata una possibile associazione tra l'utilizzo di mezzi di contrasto contenenti gadolinio e fibrosi sistemica nefrogenica. Questi mezzi di contrasto devono quindi essere utilizzati con cautela in pazienti con moderata insufficienza renale (GFR 30-59 ml/min/1,73m²) e sono controindicati in pazienti con insufficienza renale grave (GFR <30 ml/min/1,73m²).

E' affetto da insufficienza renale? SI NO

Il paziente (Età>30 anni) ha effettuato il seguente esame: Creatininemia SI NO

Informato dell'indicazione clinica, delle modalità di svolgimento e delle eventuali complicanze e rischi connessi, acconsento alla somministrazione di mezzo di contrasto: SI NO

Data: _____ Firma del paziente/volontario _____

Data _____ Firma del Medico _____

MR missile effect

Two magnets close to each other:

- Align themselves to one another positive-to-negative. In the case of a ferromagnetic object brought near an MRI, one weighs perhaps 12 tons and is bolted to the floor, the other is a pair of scissors that weigh a few ounces. Which of these two things is going to rotate to align itself?
- Smaller ferromagnetic objects that we wear, carry, or have placed within our bodies can twist, turn and even tear whatever may be trying to hold them in place.

MR missile effect

- Attractive force: two aligned magnets are attracted (think about a magnet on the fridge door). Missile effect because ferromagnetic objects, propelled by enormous amounts of magnetic energy, can launch across the room with tremendous force towards an MRI. towards the peak of the magnetic field (typically the center of the MRI).

Oxygen tank example

MR safety

Aneurysm clips can be stripped away from the blood vessels leading to death

Oggetti volanti possono uccidere la gente.
Anche se non creano incidenti gravi, possono volare nel magnete e danneggiarlo o richiedono un arresto costoso del sistema.

Image Contrast – What does it depend on?

- ❖ Remember: radiation needs to interact with the body's tissues in some differential manner to provide contrast
- ❖ X-ray/CT: differences in e^- density ($e^-/\text{cm}^3 = \rho \cdot e^-/g$)
- ❖ Ultrasound: differences in acoustic impedance ($Z = \rho \cdot c$)
- ❖ Nuclear Medicine: differences in tracer concentration (ρ)
- ❖ MRI: many intrinsic and extrinsic factors affect contrast
 - ❖ intrinsic: $\rho_H, T1, T2, \text{flow, perfusion, diffusion, ...}$
 - ❖ extrinsic: TR, TE, TI, flip angle, ...

MRI parameters

MRI contrast depends on a large set of parameters:

- Intrinsic parameters include:
 - proton density
 - velocity
 - spin-lattice relaxation time (T1)
 - diffusion
 - spin-spin relaxation time (T2)
 - perfusion
 - chemical environment
 - temperature
- Extrinsic parameters include:
 - echo time (TE)
 - saturation pulses
 - repetition time (TR)
 - inversion pulses
 - flip angle (α)
 - flow compensation pulses
 - contrast agents
 - diffusion sensitization pulses

Where do these parameters come from?

Magnetic Moment and Spin

Atomic nuclei with an odd number of neutrons and/or protons have a small *magnetic moment* and an angular momentum called *nuclear spin* (e.g. H_2O)

Nuclei	Unpaired Protons	Unpaired Neutrons	Net Spin	γ (MHz/T)
^1H	1	0	1/2	42.58
^2H	1	1	1	6.54
^{31}P	1	0	1/2	17.25
^{23}Na	1	2	3/2	11.27
^{14}N	1	1	1	3.08
^{13}C	0	1	1/2	10.71
^{19}F	1	0	1/2	40.08

When $B_0 \neq 0$ protons will either align *parallel* to the magnetic field or *anti-parallel* to it and a small excess ($1/10^5$) of parallel vs antiparallel spins leads to a net magnetization M_0

Larmor equation

the energy difference between the high (antiparallel) and low (parallel) energy states is expressed by the Larmor equation:

$$f = \gamma B_0 \text{ with } (\gamma = 42.58 \text{ MHz/T})$$

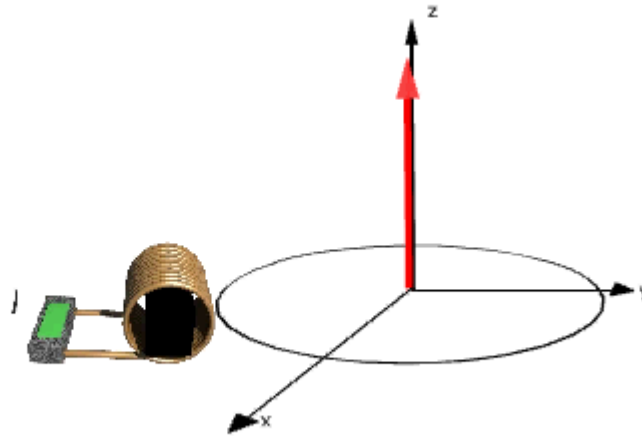

Resonance

Through Resonance protons can flip between energy states as long as the specific frequency is used

RF excitation

This is achieved by RF pulses used to flip M_0 out of alignment with B_0

M_0 from a non-equilibrium state returns to the equilibrium distribution.

These two principal relaxation processes are described in terms of T_1 and T_2 relaxation times respectively.

T1 (Spin-Lattice) relaxation

T_1 relaxation involves redistributing the populations of the nuclear spin states to reach the thermal equilibrium distribution.

Relaxation mechanisms allow nuclear spins to exchange energy with their surroundings (*lattice*)

T_1 relaxation strongly depends on the NMR frequency and so varies considerably with B_0

T1 and TR

T1 = recovery of longitudinal (B_0) magnetization after the RF pulse

- used in anatomical images
- ~500-1000 msec (longer with bigger B_0)

TR (repetition time) = time to wait after excitation before sampling T1

Developing Contrast Using Weighting

- *Contrast* = difference in image values between different tissues
- T1 weighted example: gray-white contrast is possible because T1 differs between these two types of tissue

T1-weighted image (usually used for anatomical images) measures the rate at which different types of molecules (and by extension tissue) approach M_0 at different rates allowing us to differentiate things like white and grey matter:

Healthy subject

Tumor Patient

T2 (Spin-Spin) relaxation

T_2 relaxation corresponds to a decoherence of the M_{xy}

Random fluctuations of B lead to random variations of frequency of spins

The initial phase coherence is eventually lost

T_2 values are generally much less dependent from B_0 than T_1 values

T2 and TE

T2 = decay of transverse magnetization after RF pulse

TE (time to echo) = time to wait to measure T2 or T2* (after re-focusing with spin echo)

T1 vs. T2

- effectively, T1 and T2 images are the inverse of one another, with T1 typically used to form anatomical images and T2* used in fMRI

T1 vs. T2

Contrast, TR and TE

TR	Long	Proton Density	T2-Weighted
	Short	T1-Weighted	Proton Density
		Short	Long

TE

Properties of Body Tissues

Tissue	T1 (ms)	T2 (ms)
Grey Matter (GM)	950	100
White Matter (WM)	600	80
Muscle	900	50
Cerebrospinal Fluid(CSF)	4500	2200
Fat	250	60
Blood	1200	100-200

T1 values for $B_0 \sim 1$ Tesla.

T2 $\sim 1/10^{\text{th}}$ T1 for soft tissues

GRADATION OF INTENSITY

IMAGING						
CT SCAN	CSF	Edema	White Matter	Gray Matter	Blood	Bone
MRI T1	CSF	Edema	Gray Matter	White Matter	Cartilage	Fat
MRI T2	Cartilage	Fat	White Matter	Gray Matter	Edema	CSF
MRI T2 Flair	CSF	Cartilage	Fat	White Matter	Gray Matter	Edema

CT SCAN

MRI T1 Weighted

MRI T2 Weighted

MRI T2 Flair

Proton density, recovery (T1) and decay (T2 and T2*) times.

T1 weighted

Density weighted

T2 weighted

- By 'weighting' the pulse sequence (and point at which data is collected) different images of the brain are obtained
- Weighting is achieved by manipulating TE (time to echo) and TR (time to repetition of the pulse sequence)

Use of Magnetic Resonance Imaging in Food Quality Control: A Review

Ebrahimnejad Hamed^{1*}, Ebrahimnejad Hadi², Salajegheh A.³, Barghi H.⁴

ABSTRACT

Modern challenges of food science require a new understanding of the determinants of food quality and safety. Application of advanced imaging modalities such as magnetic resonance imaging (MRI) has seen impressive successes and fast growth over the past decade. Since MRI does not have any harmful ionizing radiation, it can be considered as a magnificent tool for the quality control of food products. MRI allows the structure of foods to be imaged noninvasively and nondestructively. Magnetic resonance images can present information about several processes and material properties in foods. This review will provide an overview of the most prominent applications of MRI in food research.

¹DDS, MSc, Department of Oral and Maxillofacial Radiology, Faculty of Dentistry, Kerman University of Medical Sciences, Kerman, Iran

²DVM, Ph.D., Assistant Professor, Department of Food Hygiene and Public Health, Faculty of Veterinary Medicine, Shahid Bahonar University of Kerman, Kerman, Iran

⁴DDS, MSc, Assistant Professor, Department of Pediatric Dentistry, Faculty of Dentistry, Shiraz University of Medical Sci-

- Today, MRI is used at online quality control systems for meat, fruits and vegetables
- Exquisite method for imaging the distribution of muscle and fat
- The processes during cooking, such as the amount of
- oil uptake in the meat frying process
- In fish products in order to monitor, for example to optimize brining

- Muscle structure (DW MRI)
- MRI can be utilized to monitor the structural events occurring during cooking, proofing of dough and baking
- During cooking, structural and physical properties of meat would change, such as deformation and water transfer in meat
- Freezing mechanisms, crystallization and ice formation
- Fruits and vegetables: soil, root, stem and leaf water content and transport
- Internal quality assessment and monitoring of ripening of a wide variety of fruits: apple, avocado, blueberry, cucumber, durian, kiwifruit, mandarin, mango, melon, nectarine, olive, onion, orange, papaya, pear, peach, pineapple, potato, persimmon, pomegranate, tangerine, tomato, strawberry, melon, watermelon and oil palm fruit
- Distinguish mealy from fresh fruits
- MRI is a technique which can detect and follow up the development of storage disorders over time.
