ALTERAZIONI E CONSEGUENZE DEL PROESSO DI FOLDING

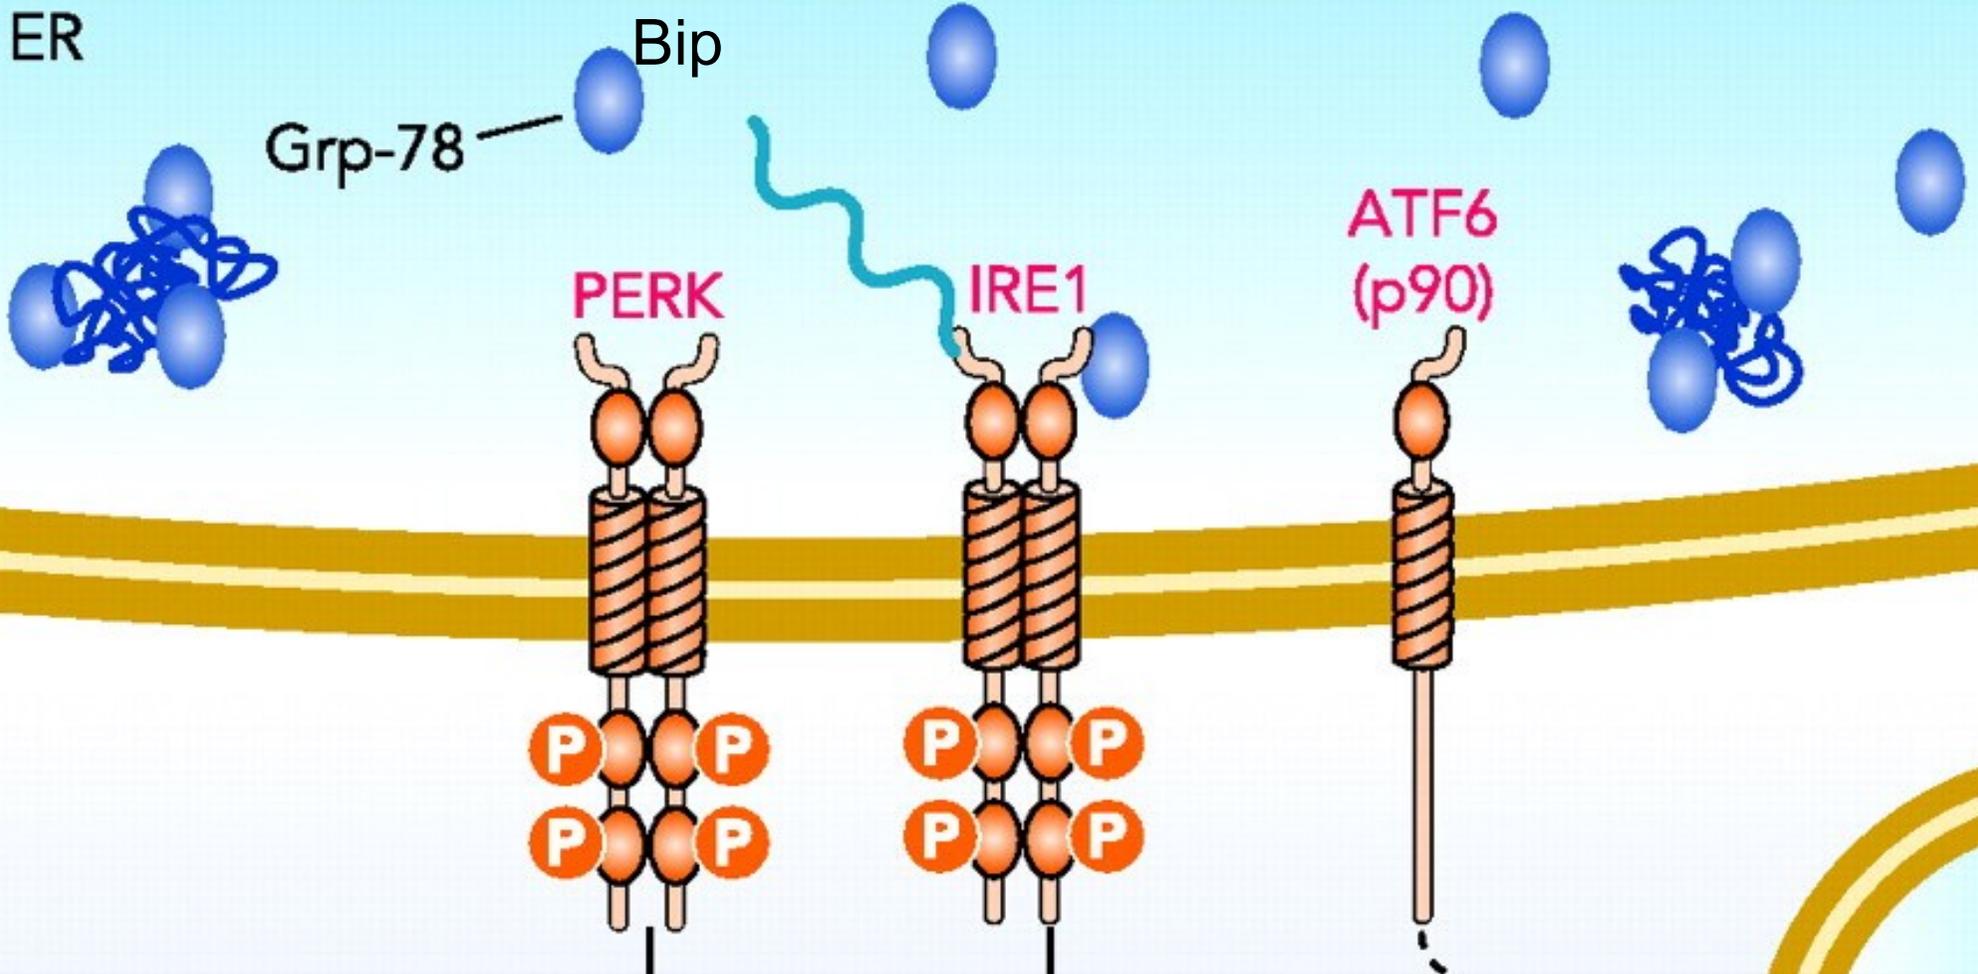

TRIGGERS OF ER STRESS

- Development of secretory cells
 - pancreatic β cells
 - plasma cells
- Altered metabolism
 - glucose deprivation
 - hyperhomocysteinemia
- Genetic mutation
 - DNA damage
 - mutated secretory proteins
- Pathogenesis
 - polyglutamine neuropathies
 - viral infection
- Chemical insult
 - inhibition of *N*-linked glycosylation
 - disruption of Ca^{2+} homeostasis

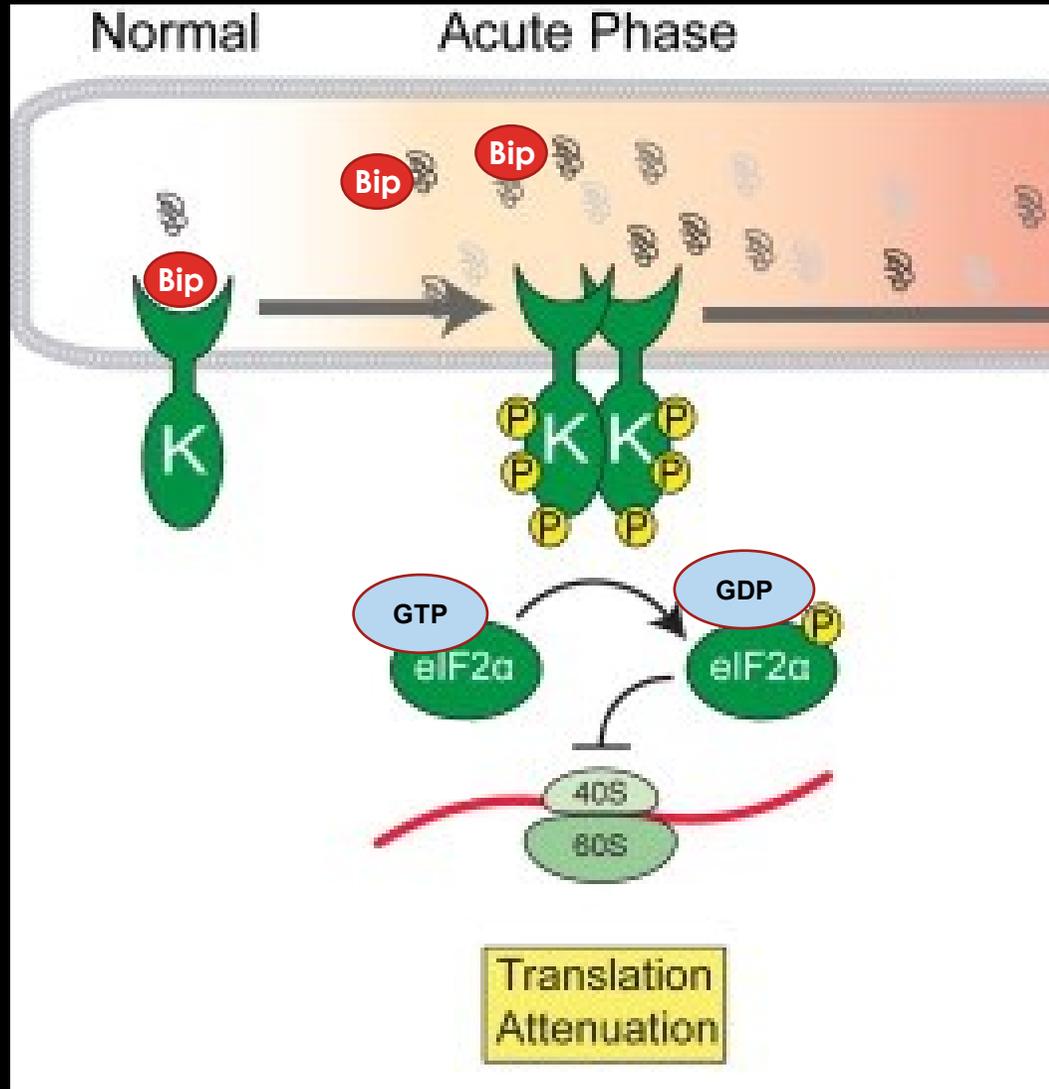

THE UNFOLDED PROTEIN RESPONSE (UPR)

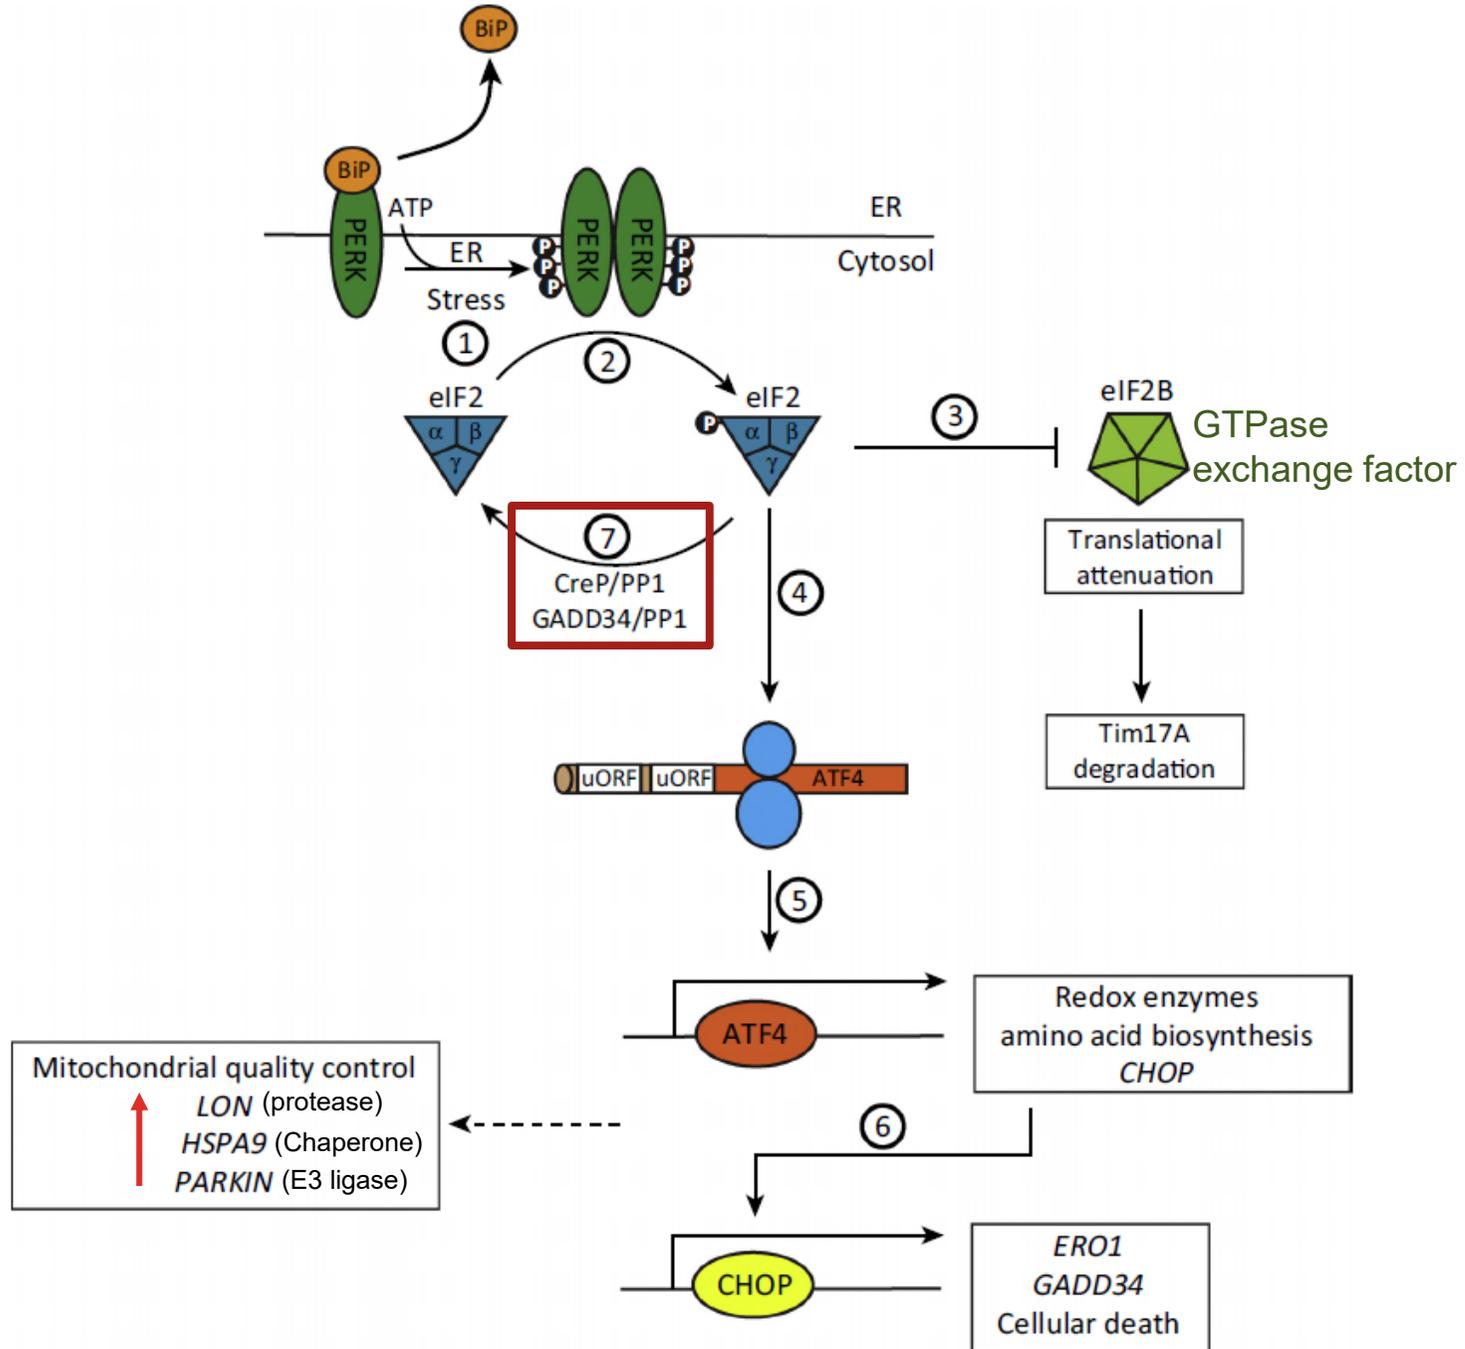

THE UNFOLDED PROTEIN RESPONSE (UPR)

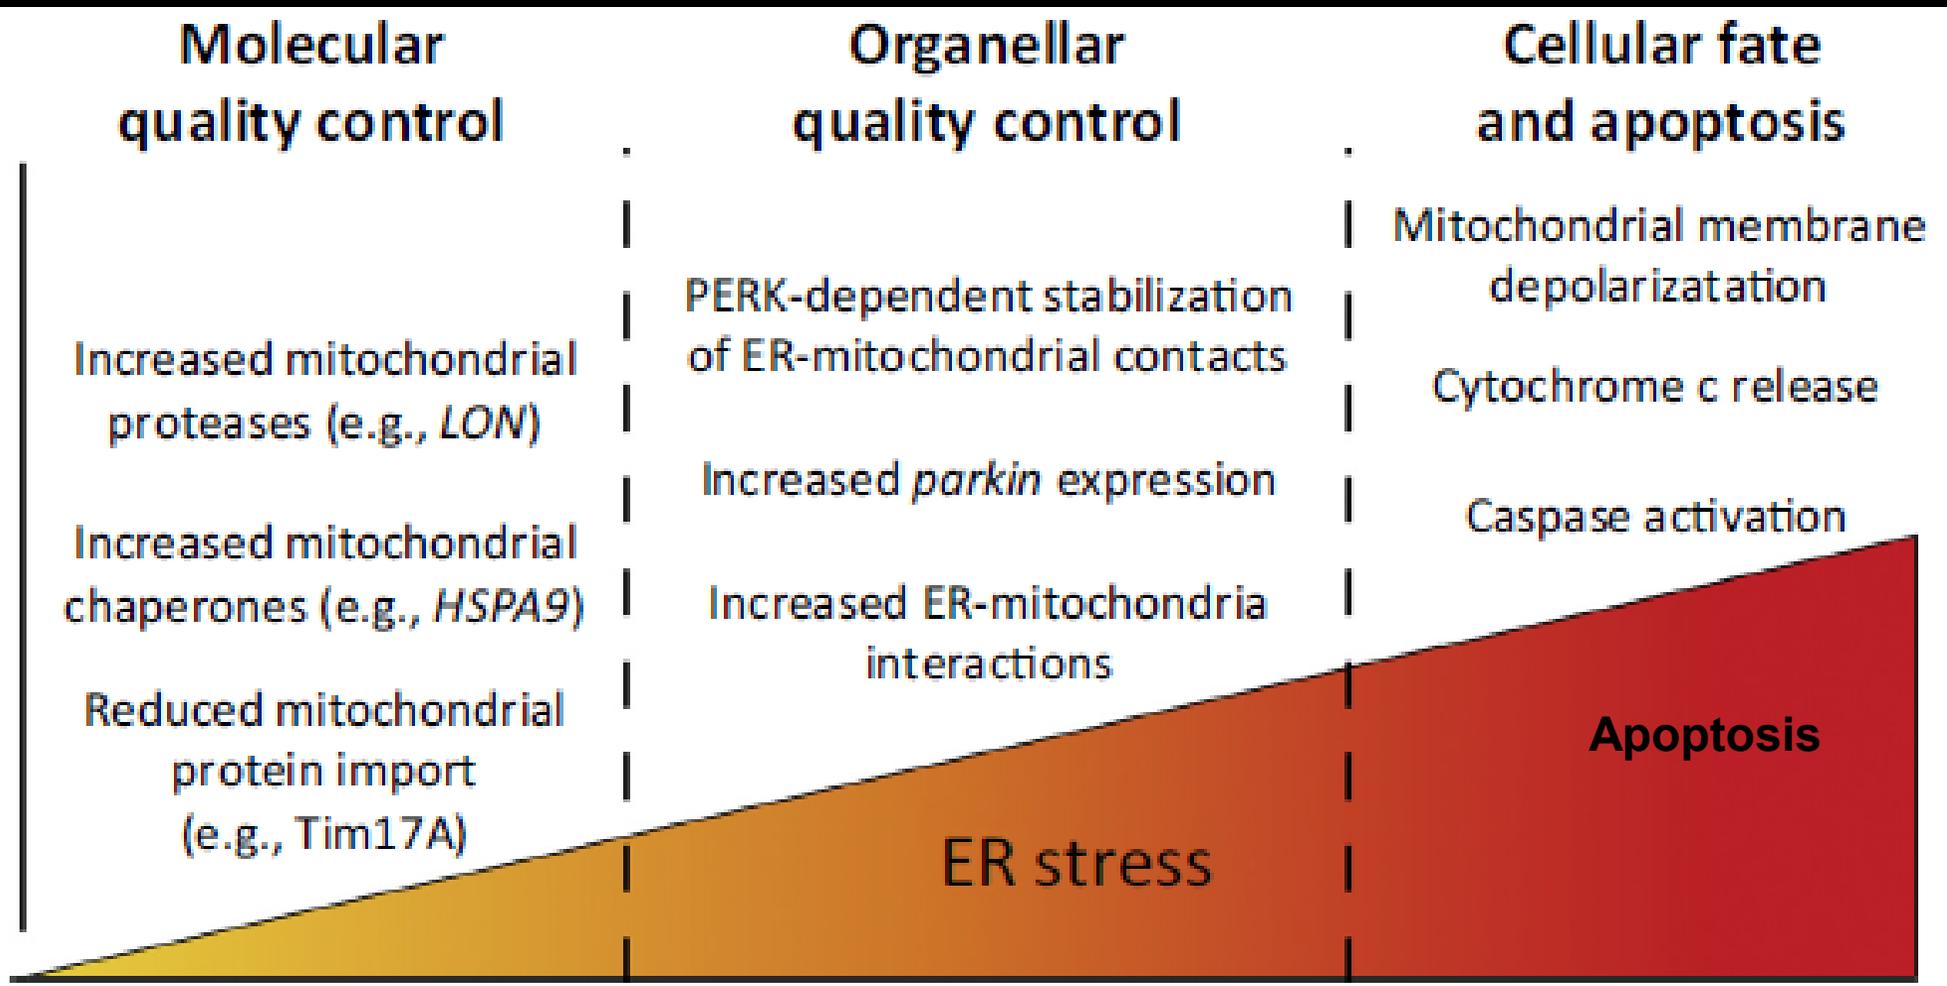

PERK PATHWAY

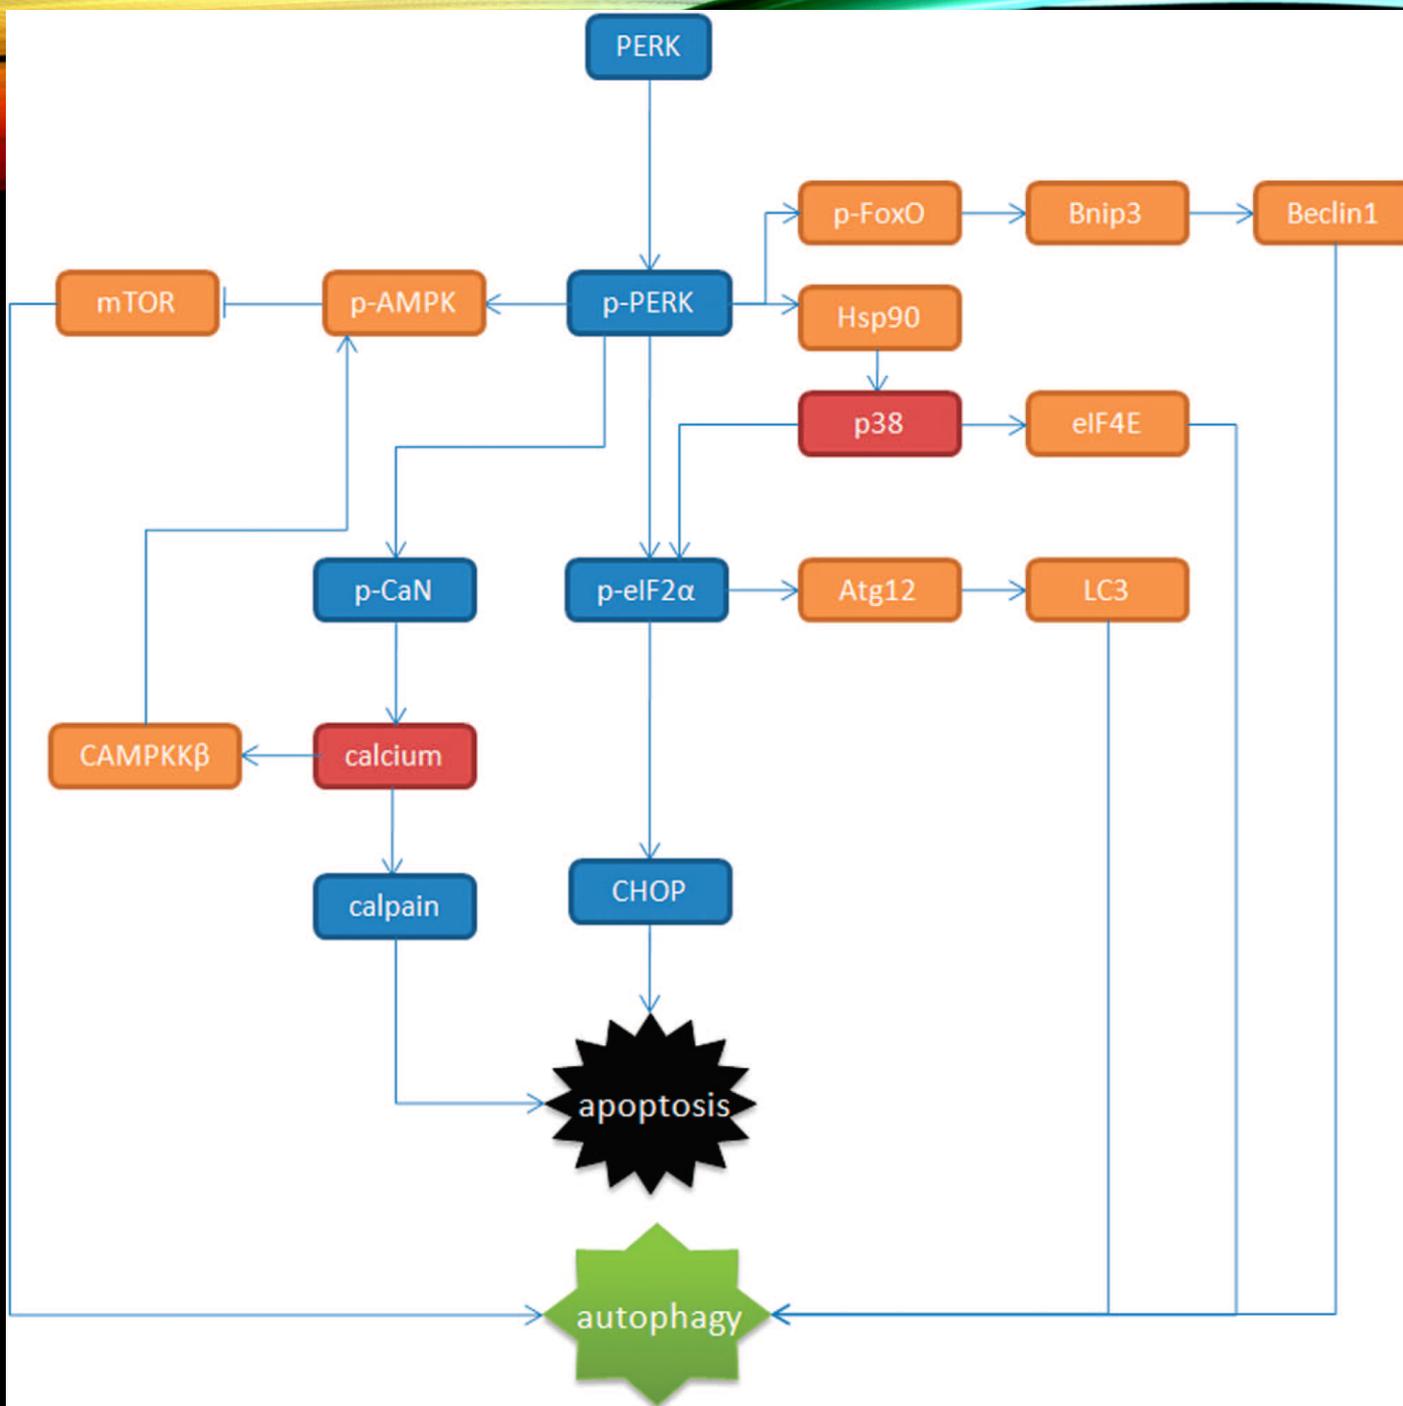

IMPACT OF PERK SIGNALLING ON MITOCHONDRIA

Impact of PERK

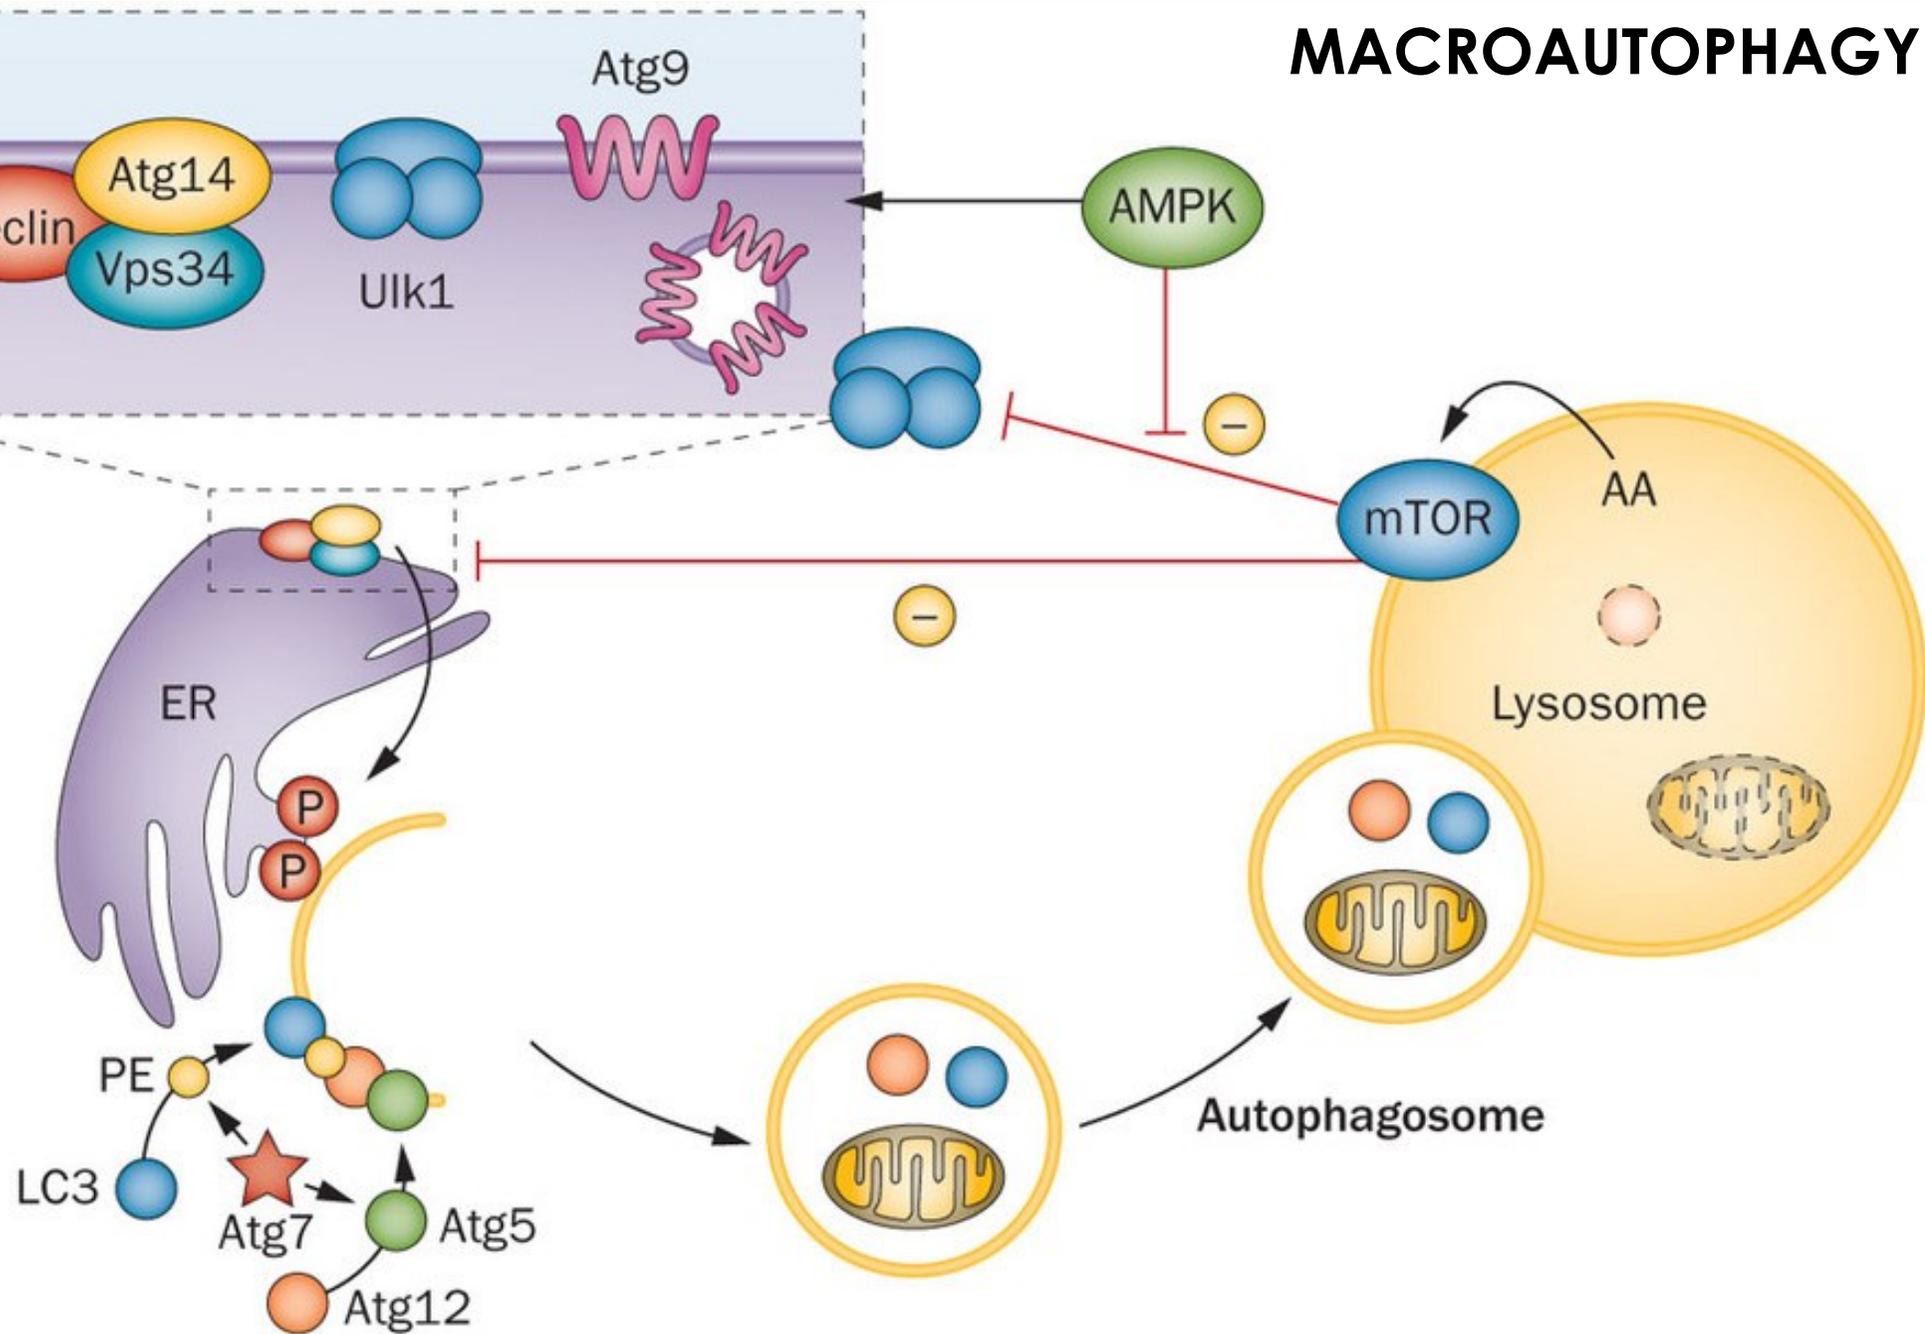

- An intracellular homeostatic mechanism important for degradation of cytoplasmic components in acidic lysosomal compartment
- Targets:
 - Intracellular organelle
 - Misfolded proteins
- Main aims:
 1. It disassembles unnecessary or dysfunctional components
 2. It promotes cellular survival by maintaining cellular energy levels during starvation
 3. adaptive response to stress, this promotes cellular survival in cancer

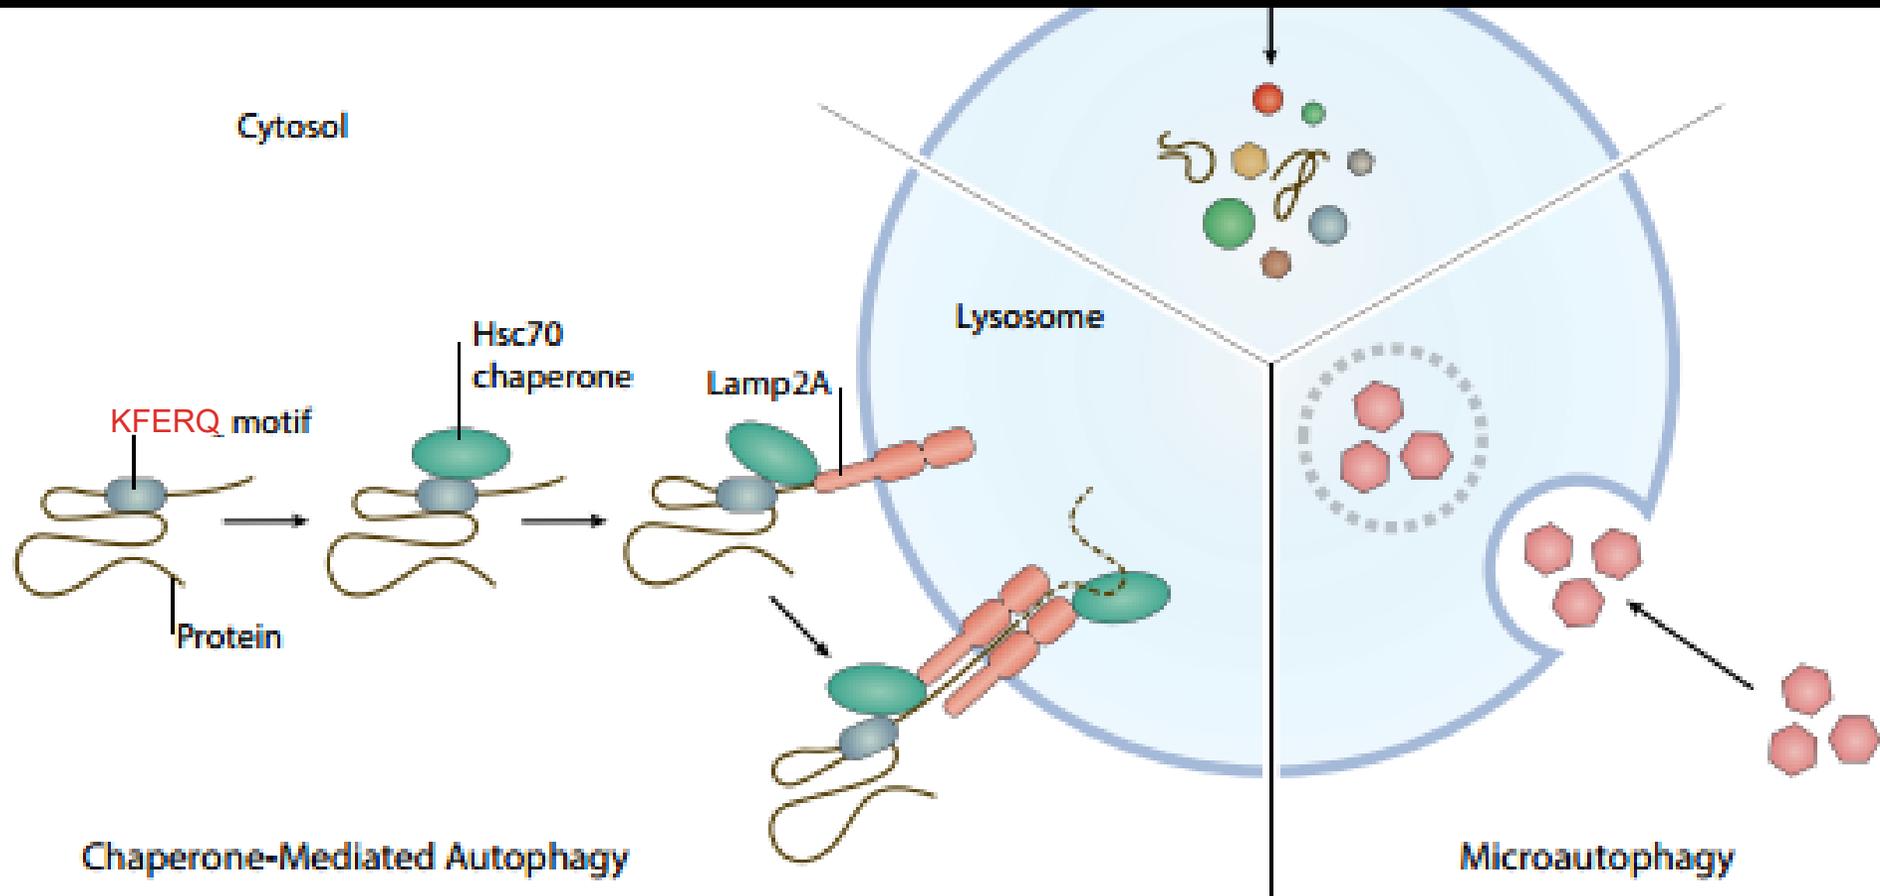

AUTOPHAGY²⁵

- **Macroautophagy**
 - it is used primarily to waste damaged cell organelles or unused proteins. This involves the formation of a double membrane known as an autophagosome, around the organelle marked for destruction.
- **Microautophagy**
 - It involves the direct engulfment of cytoplasmic material into the lysosome. This occurs by inward folding of the lysosomal membrane.
- **Chaperone-mediated autophagy**
 - It is a protein specific pathway which involves the recognition of KFERQ sequence by the hsc70-containing complex and translocation through the lysosomal membrane.
