The background of the slide is a dark, almost black, space filled with a complex network of thin, light-colored lines. Scattered throughout this network are numerous 3D objects: large, glossy blue spheres of varying sizes, and smaller, semi-transparent cubes in shades of pink, red, yellow, and green. The blue spheres are the most prominent, with some being significantly larger than others. The cubes are smaller and more numerous, often appearing to be connected to the spheres or to each other by the network lines. The overall effect is that of a dense, interconnected system, likely representing a biological network or a complex data structure.

# Networks topology

**Table 1: Main topological parameters of capacitation and AR networks**

	capacitation	AR
N°nodes	146	141
N°edges	197	191
Clustering coefficient	0.029	0.026
Diameter	20	20
Averaged n°neighbours	2.667	2.695
Char. path length	6.606	6.736

The number of nodes represent the total number of molecules involved, the number of edges represents the total number of interaction found, the clustering coefficient is calculated as  $Cl = 2nl/k(k-1)$ , where  $nl$  is the number of links connecting the  $k$  neighbours of node  $l$  to each other, the network diameter is the largest distance between two nodes, the Averaged n°neighbours represent the mean number of connection of each node, the Char. path length gives the expected distance between two connected nodes.

**Table 2: Result of power law fitting of IN and OUT capacitation and AR networks**

	capacitation		AR	
	in	out	in	out
r	0.992	0.997	0.992	0.989
R <sup>2</sup>	0.897	0.837	0.906	0.823
b	-1.547	-2.046	-1.657	-2.303

**Table 3: Most connected nodes (the hubs) of capacitation and AR networks**

Network	Node	Number of links
capacitation	[Ca <sup>2+</sup> ] <sub>i</sub>	25
capacitation	ATP	14
capacitation	Tyr phosphorylation	13
capacitation	PKA	9
capacitation	ADP	8
capacitation	PLD1	8
AR	[Ca <sup>2+</sup> ] <sub>i</sub>	23
AR	ATP	13

# Hubs removal

Figure 4 Diagram showing the effect of the elimination from capacitance network of the most linked nodes. The elimination from capacitance network of the most linked nodes ( $[Ca^{2+}]$  and ATP-ADP) caused the collapse of network structure.

Figure 5 Diagram showing the effect of the elimination from AR network of the most linked nodes. The elimination from AR network of the most linked nodes ( $[Ca^{2+}]$  and ATP-ADP) caused the collapse of network structure.

# Common elements

**Table 4: Main topological parameters and the most connected nodes of C A network**

	C A
N°nodes	109
N°edges	143
Clustering coefficient	0.036
Diameter	20
Averaged n°neighbours	2.606
Char. path length	6.957
IN degree distribution	b = -1.829 r = 0.997 R <sup>2</sup> = 0.948
OUT degree distribution	b = -2.240 r = 0.992 R <sup>2</sup> = 0.894
Hub (n°edges)	ATP (13); Ca <sup>2+</sup> (12)

The number of nodes represent the total number of molecules involved, the number of edges represents the total number of interaction found, the clustering coefficient is calculated as  $Cl = 2nl/k(k-1)$ , where  $nl$  is the number of links connecting the  $kl$  neighbours of node  $l$  to each other, the network diameter is the largest distance between two nodes, the Averaged n°neighbours represent the mean number of connection of each node, the Char. path length gives the expected distance between two connected nodes.

# Consequently ...

- It is possible to represent the biological events involved in reproduction as networks models;
- They are scale free networks;
- They have a ultra small-world topology;
- It is possible to take important inferences.

# Experimental validation of the model

## The role of actin in capacitation-related signaling: an *in silico* and *in vitro* study

Nicola Bernabò\*, Paolo Berardinelli, Annunziata Mauro, Valentina Russo, Pia Lucidi, Mauro Mattioli and Barbara Barboni

# Organization of signalig systems

**Table 2** Most connected nodes (the hubs) of capacitation network

Node	Number of links
$[Ca^{2+}]_i$	28
ATP	15
Tyr phosphorylation	13
PKA	9
ADP	8
PLD1	8
NADH	8
Actin polymerization	8

# networks topology

**Table 1 Main topological parameters of capacitation network**

Parameter	Value
N° nodes	153
N° edges	204
Clustering coefficient	0.056
Diameter	12
Averaged n° neighbours	2.654
Char. path length	4.995

The number of nodes represent the total number of molecules involved, the number of edges represents the total number of interaction found, the clustering coefficient is calculated as  $Cl = 2n_l/k(k-1)$ , where  $n_l$  is the number of links connecting the  $k_l$  neighbours of node  $l$  to each other, the network diameter is the largest distance between two nodes, the Averaged n° neighbours represent the mean number of connection of each node, the Char. path length gives the expected distance between two connected nodes.

**Table 3 Main topological parameters of capacitation network after "actin polymerization" node removal**

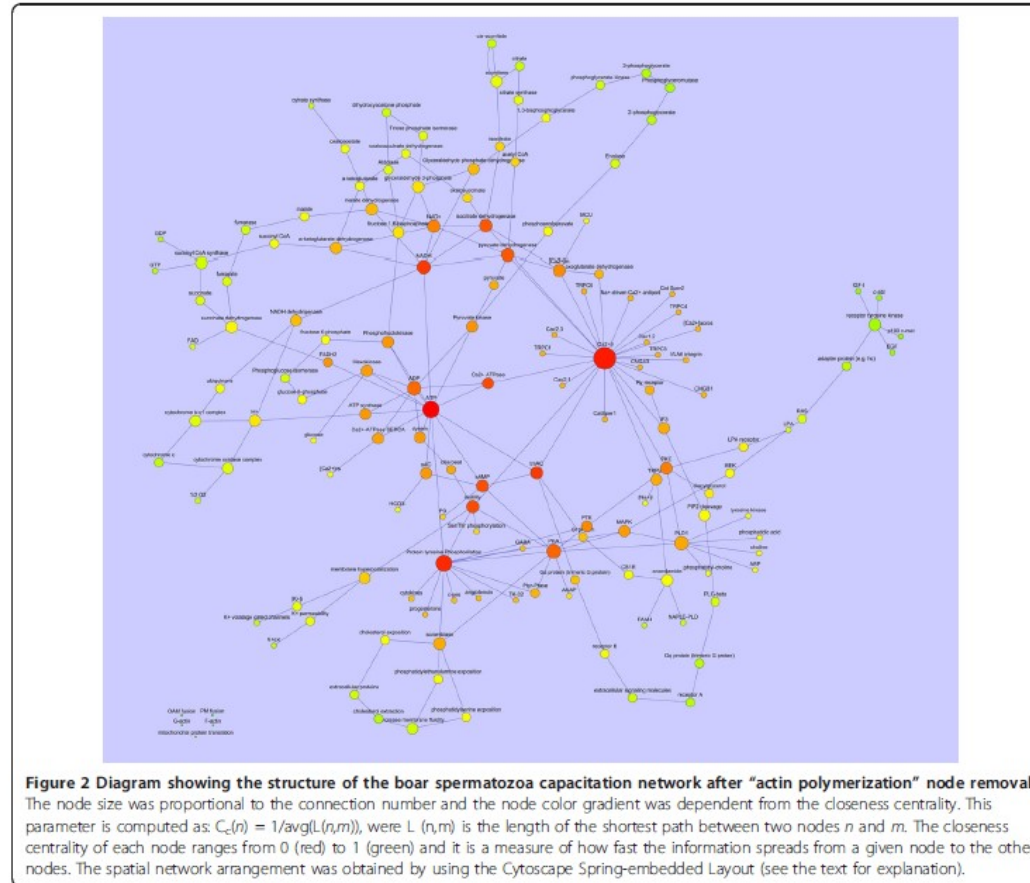

Parameter	Value
N° nodes	152
N° edges	196
Clustering coefficient	0.056
Diameter	12
Averaged n° neighbours	2.566
Char. path length	6.071
Degree distribution	$b = -1.563$ $r = 0.809$ $R^2 = 0.898$

The number of nodes represent the total number of molecules involved, the number of edges represents the total number of interaction found, the clustering coefficient is calculated as  $Cl = 2n_l/k(k-1)$ , where  $n_l$  is the number of links connecting the  $k_l$  neighbours of node  $l$  to each other, the network diameter is the largest distance between two nodes, the Averaged n° neighbours represent the mean number of connection of each node, the Char. path length gives the expected distance between two connected nodes.

$$b = -1.578$$

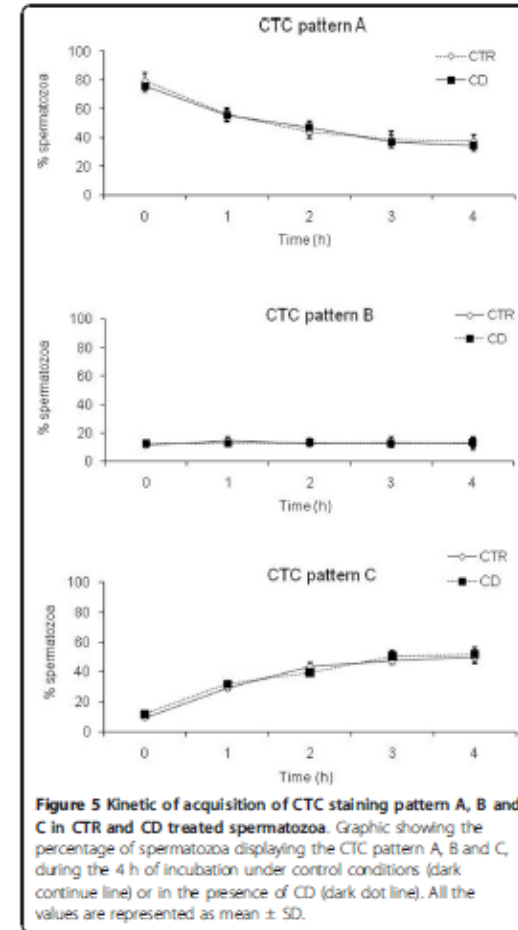

# Membrane fusion is impossible

# F-actin

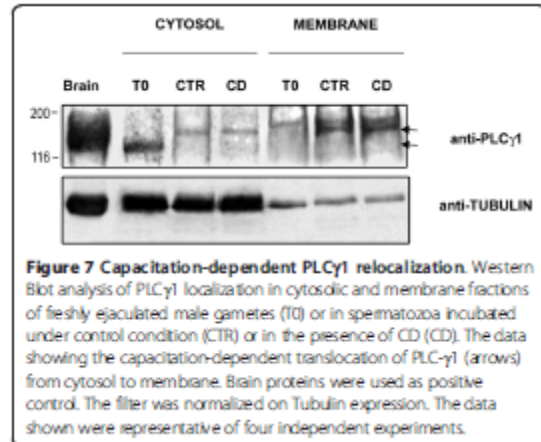

# CTC

# protein tyrosine phosphorylation

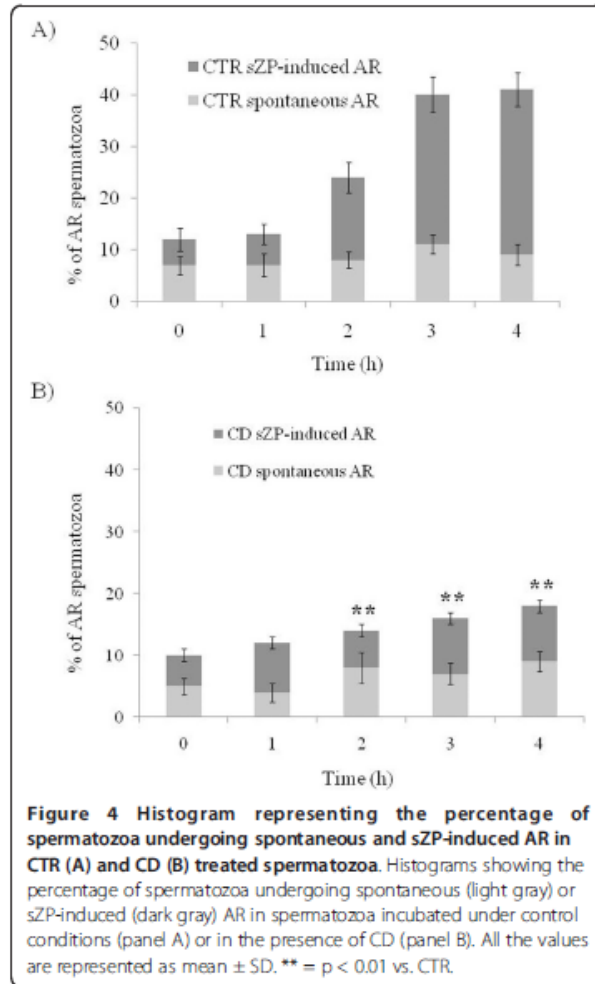

# PLC- $\gamma$ 1

# Ca<sup>2+</sup>

# Acrosome reaction

# In conclusion

- The model has been validated;
- A new role of actin during sperm capacitation has been proposed.

# Evolution of the system

Signaling Strategy in Spermatozoa Activation of Sea Urchin, *C. elegans* and Human: Three Different Players for the Same Melody

Nicola Bernabò\*, Ilaria Saponaro, Mauro Mattioli and Barbara Barboni  
Department of Comparative Biomedical Sciences, University of Teramo, Teramo, Italy

	Sea urchin	<i>C. elegans</i>	Human
Symmetry	Fivefold	Bilateral	Bilateral
Sexes	Male/Female	Hermaphrodite/ Male	Male/Female
Fertilization	External	Internal	Internal
Sperm motility	Flagellum	Amoeboid	Flagellum
Acrosome reaction	Yes	No	Yes
Membrane remodeling	No	Yes	Yes
Cytoskeleton remodeling	Actin	MSP	Actin
Time for sperm activation	Seconds	Days	Hours to days

Table 5: Main biological characteristics of reproduction and spermatozoa in sea urchin, *C. elegans* and Human.

The nodes diameter is proportional to the number of links, the color varies depending on the closeness centrality (see text for explanation). The networks were spatially represented using the Cytoscape Degree Sorted Circle Layout: all nodes with the same number of links are located together around the circle (see Cytoscape's User Manual).

Figure 1: Diagram showing the sea urchin spermatozoa activation network.

The nodes diameter is proportional to the number of links, the color varies depending on the closeness centrality (see text for explanation). The networks were spatially represented using the Cytoscape Degree Sorted Circle Layout: all nodes with the same number of links are located together around the circle (see Cytoscape User Manual).

Figure 2: Diagram showing the *C. elegans* spermatozoa activation network.

The nodes diameter is proportional to the number of links, the color varies depending on the closeness centrality (see text for explanation). The networks were spatially represented using the Cytoscape Degree Sorted Circle Layout: all nodes with the same number of links are located together around the circle (see Cytoscape User Manual).

Figure 3: Diagram showing the Human spermatozoa activation network.

	Sea urchin	<i>C. elegans</i>	Human
N° nodes	127	100	151
N° edges	175	132	202
Clustering coefficient	0.023	0.032	0.028
Diameter	23	23	20
Avg. n° neighbours	2.740	2.620	2.662
Char. path length	8.128	7.816	6.546

The number of nodes represent the total number of molecules involved; the number of edges represents the total number of interactions; the clustering coefficient is calculated as  $Cl = 2nl / k(k-1)$ , where  $nl$  is the number of links connecting the  $k$  neighbours of node  $l$  to each other; the network diameter is the largest distance between two nodes; the Averaged n° neighbours represents the mean number of connections of each node; the Char. path length gives the expected distance between two connected nodes.

**Table 1:** Main topological parameters of Sea urchin, *C. elegans* and Human spermatozoa activation networks.

	Sea urchin		<i>C. elegans</i>		Human	
	IN	OUT	IN	OUT	IN	OUT
R	0.998	0.967	0.992	0.971	0.988	0.997
R <sup>2</sup>	0.748	0.924	0.866	0.884	0.890	0.828
b	-1.589	-2.421	-2.067	-2.127	-1.542	-1.993

**Table 2:** Results of power law fitting of IN and OUT sea urchin, *C. elegans* and Human spermatozoa activation networks.

Sea urchin		<i>C. elegans</i>		Human	
Node	N° of links	Node	N° of links	Node	N° of links
[Ca <sup>2+</sup> ] <sub>i</sub>	19	[Ca <sup>2+</sup> ] <sub>i</sub>	10	[Ca <sup>2+</sup> ] <sub>i</sub>	25
[H <sup>+</sup> ] <sub>i</sub>	14	[H <sup>+</sup> ] <sub>i</sub>	9	Tyr phosph.	13
ATP	9	ATP	7	ATP	15
cGMP	15	Motility	8	PKA	9
cAMP	13	Vesicle fusion	7		
		NADH	7		
		NAD <sup>+</sup>	6		
		Pseudopod extension	6		

**Table 3:** Most connected nodes (the hubs) of sea urchin, *C. elegans* and Human spermatozoa activation networks.

# In conclusion

- Different organisms share the same topology

# Sptz as model

- Disposable cells;
- Transcriptionally silent;
- IVF to evaluate their function.

# Possible applications

- Contraception;
- unexplained infertility;
- Personalized medicine;
- in vivo – in vitro - in silico systems

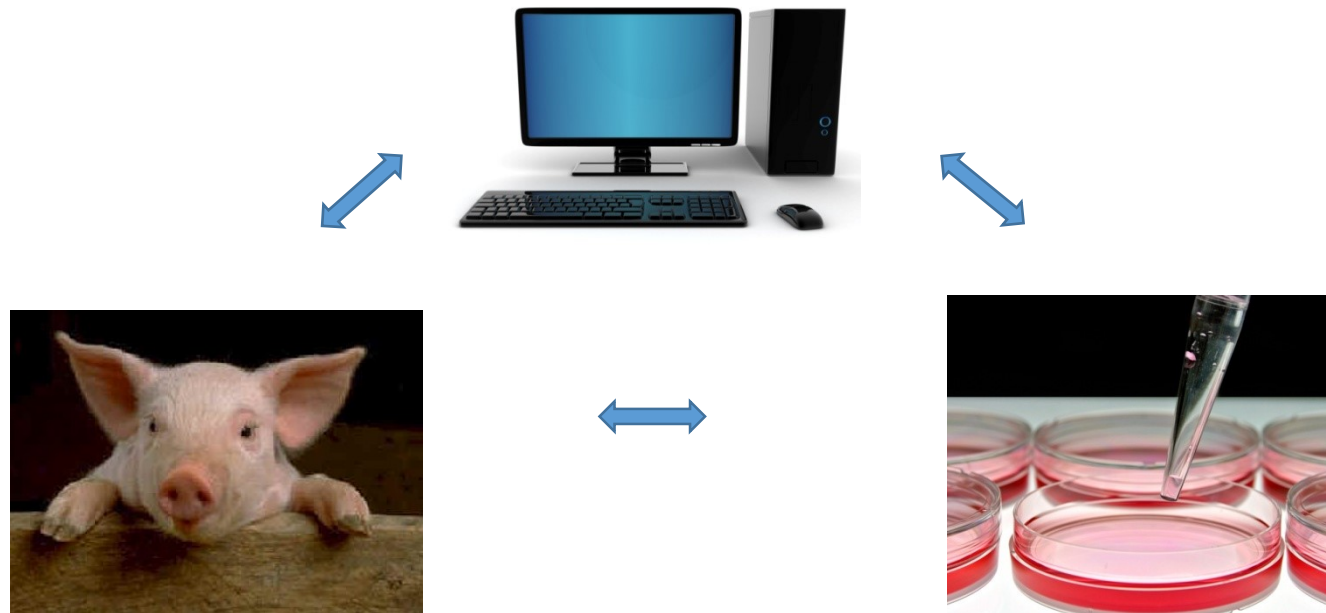

Table 1 Main topological parameters of examined networks

		Topological parameters								
		No. nodes	No. edges	CC	Diameter	Avg. no. neighbours	Char. path length	Nodes degree exponent ( $\gamma$ )	$r$	$R^2$
